

Technical documentation - AML Configuration API

AML Config is the configuration module that enables management of AML rulesets, actions, and value sets through an administrative panel.

It exposes a REST API for defining, activating, and updating AML configuration used by the AML Core service.

Integration with this API is not required when the client uses [Verestro's Administration Panel](#), which is already fully integrated with AML Config.

When purchasing the full [Administration Panel](#) + [Antaca](#) + **AML Transaction Monitoring** package, the only required client action is defining AML rulesets through the Administration Panel.
