

# Introduction

**IBAN Management Service** is a solution provided by Verestro that enables comprehensive management of bank accounts for both **Partners** and **endusers**. The system allows for the **generation of virtual accounts** linked to an existing **master account**. IBAN Management Service also supports **incoming and outgoing transfers** both from the master account and the virtual accounts, ensuring flexible and transparent management of financial resources.

As part of the integration, it is also possible to create an [Admin Panel](#) instance for you which allows you to track and manage transfers made using the IBAN Management solution.

The solution is available to Partners integrated with Antaca. For more information about Antaca service, please open [this link](#)

## Key Capabilities:

- **Virtual account generation**- create unlimited virtual IBANs linked to existing master accounts;
- **Multi-currency support**- process transactions in PLN, EUR, and USD;
- **Transfer processing**- handle incoming and outgoing transfers through multiple banking channels;
- **Real-time management**- monitor banking operations through Admin Panel

## How to connect with us?

Verestro provides access to the solution through REST API implementation model.

The REST API integration model involves connecting directly via a server to server path. In this case we do not provide any application view - each process is performed using the API methods according with the REST protocol. In this integration model, authorization is performed using [x509 certificate authentication](#). More detailed information about integration with IBAN Management is provided in the [documentation](#). Verestro actively supports the Partner throughout the integration process.
