

Quick introduction to Payments Tokenization

NFC Payments and Issuer Wallets: Simplicity Through Experience

NFC payments and issuer wallets are among the most complex and often misunderstood areas in the world of digital finance. Mastering them requires not only deep technological knowledge but also expertise that goes far beyond traditional payment processing. What's more, because these solutions provide direct access to processed funds, they demand the highest standards of security and compliance.

At Verestro, we have learned all these lessons the hard way- and we've encapsulated our expertise into easy-to-integrate SDKs. This means that entering the world of NFC payments and issuer wallets with us is as simple as it gets.

We guide our clients through every step:

- launching projects with Mastercard and Visa,
- configuring project requirements,
- outlining the needs of every component in the process,
- enabling services even in locations with legal restrictio.

Our SDKs are designed for seamless integration into client applications, and our team is ready to help with even the most complex internal processes. None of these challenges are new to us- we've successfully navigated them many times before.

We have real-world experience enabling contactless payments on **Android** and **iOS** devices, and even on **wearables** running dedicated operating systems.

With Verestro, it's possible! Let us make NFC payments and issuer wallets easy for you.
